

ABSTRACT

A low resistance air filter device comprises a tubular case (2) for containing a filtering element (3) fixed to a lower opening (9) of the case (2). The tubular case has an upper opening (10), with outlet means (8) provided with an air outflow opening (7). The outlet means (8), at the outflow opening (7), are provided with a tubular body protruding toward an inside tubular case (2) and connect in flow communication the inside volume of the tubular case with the outflow opening (7).
